Architectures

# Architecture Views

- Representation of a coherent set of architectural elements , as written by and read by system stakeholders.

# Documenting

- “Documenting an architecture is a matter of documenting the relevant **views** and then adding a documentation that applies to more than one view.”

# Solution to a Problem

- Problem

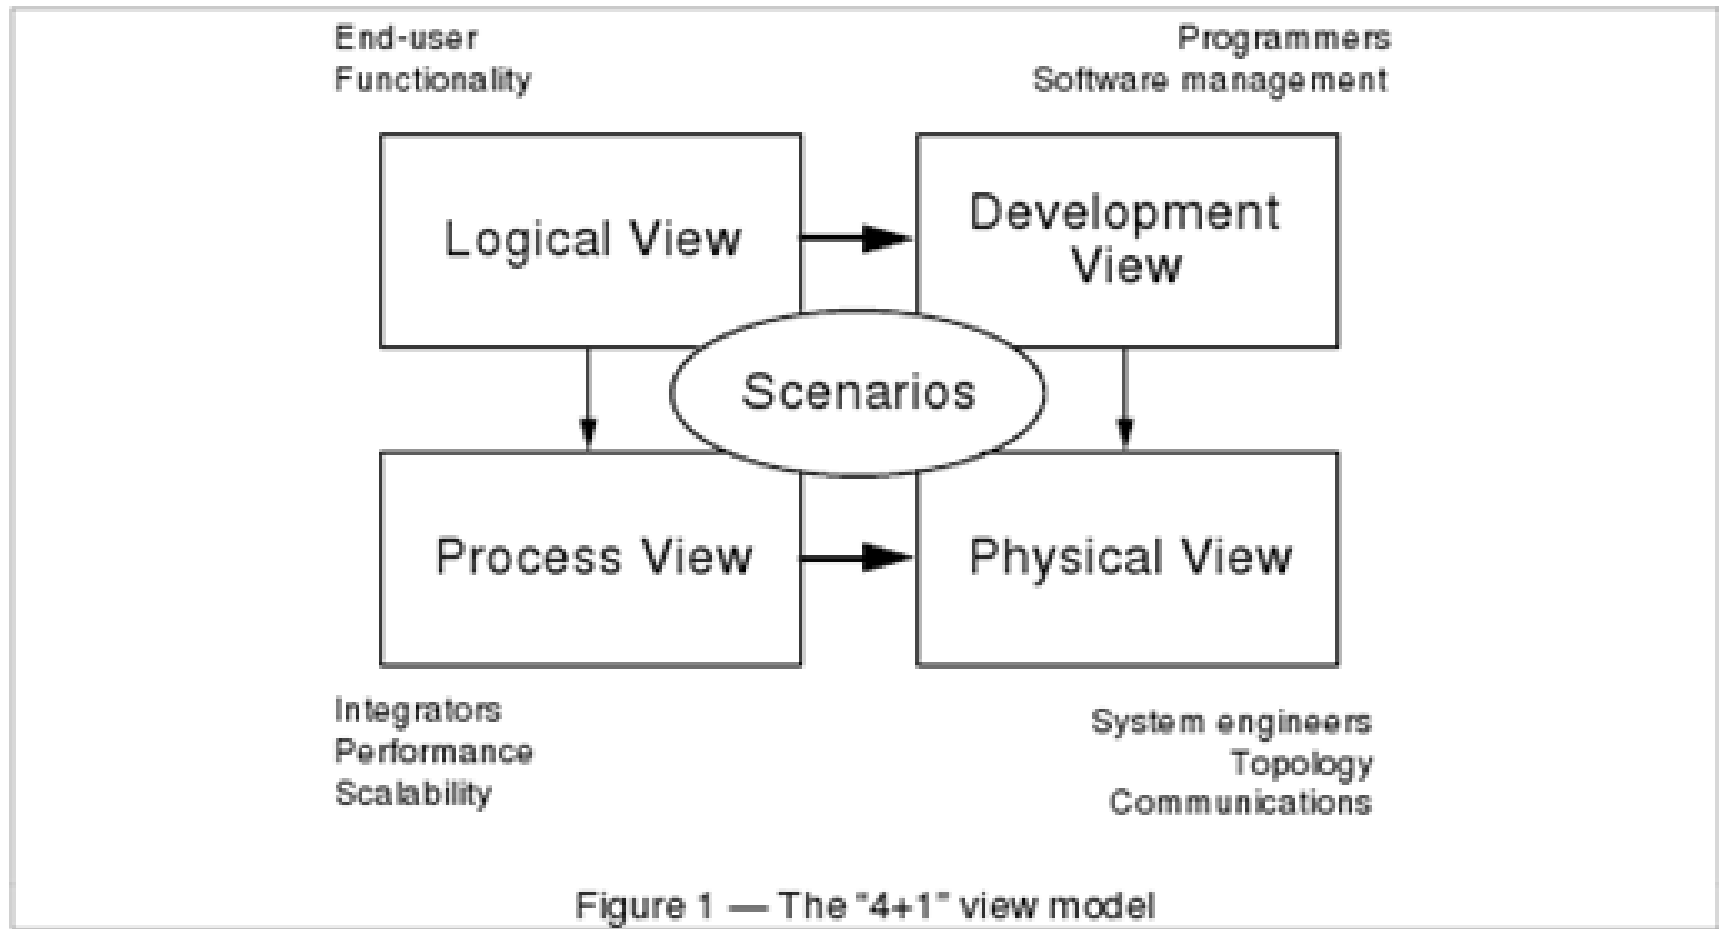

- Architecture documents do not address the concerns of all stakeholders .
- Deferent Stakeholders : end-user, system engineers, developers and project managers.
- Architecture documents contained complex diagrams some times they are hard to be represented on the documentation.

- Solution

- Using different notations for several **Views** each one addressing one specific set for concerns.

# 4+1 Model -

*Philippe Kruchten*, Rational Software Corp.

# Logical View

- **The logical view**, which is the object model of the design (when an object-oriented design method is used)

**Viewer:** End-user

**considers:** Functional requirements- What are the services must be provided by the system to the users.

**Notation:** The Booch notation .

**Tool:** Rational Rose

# Notation for Logical View-

*Philippe Kruchten*, Rational Software Corp.

## Notation for the logical view

The notation for the logical view is derived from the Booch notation<sup>4</sup>. It is considerably simplified to take into account only the items that are architecturally significant. In particular, the numerous adornments are not very useful at this level of design. We use Rational Rose<sup>®</sup> to support the logical architecture design.

### Components

Class

Class Utility

Parameterized  
Class

Class category

### Connectors

Association

Containment,  
Aggregation

Usage

Inheritance

Instanciation

Figure 2 — Notation for the logical blueprint

# Logical view Example PABX-

*Philippe Kruchten, Rational Software Corp.*

# Process View

**The process view**, which captures the concurrency and synchronization aspects of the design(**The process decomposition**).

**viewer:** Integrators

**considers:** Non - functional requirements (scalability, concurrency, and performance)

**style:** Garlan and Shaw 's Architecture styles.

# Process (cont.)

Uses multiple levels of abstractions.

A process is a grouping of tasks that form an executable unit:

- Major Tasks: Architecture relevant tasks.
- Minor or helper Tasks: (Buffering)

# Notation-

*Philippe Kruchten*, Rational Software Corp.

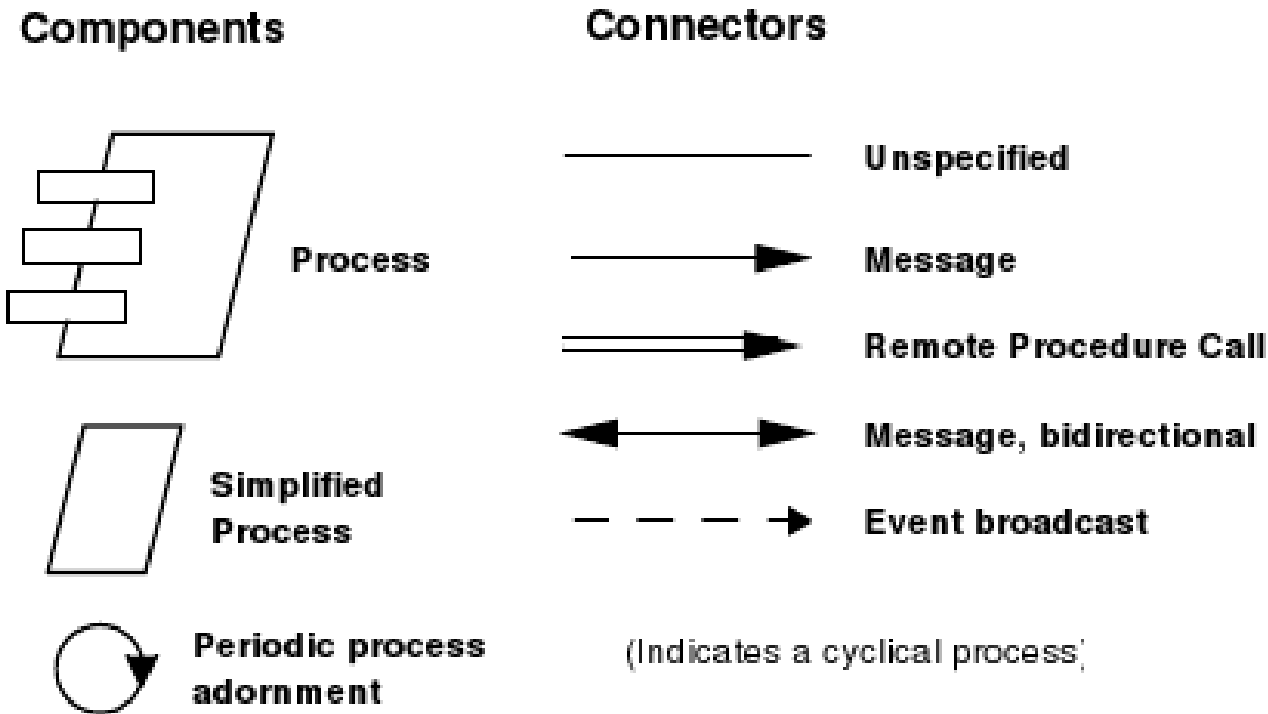

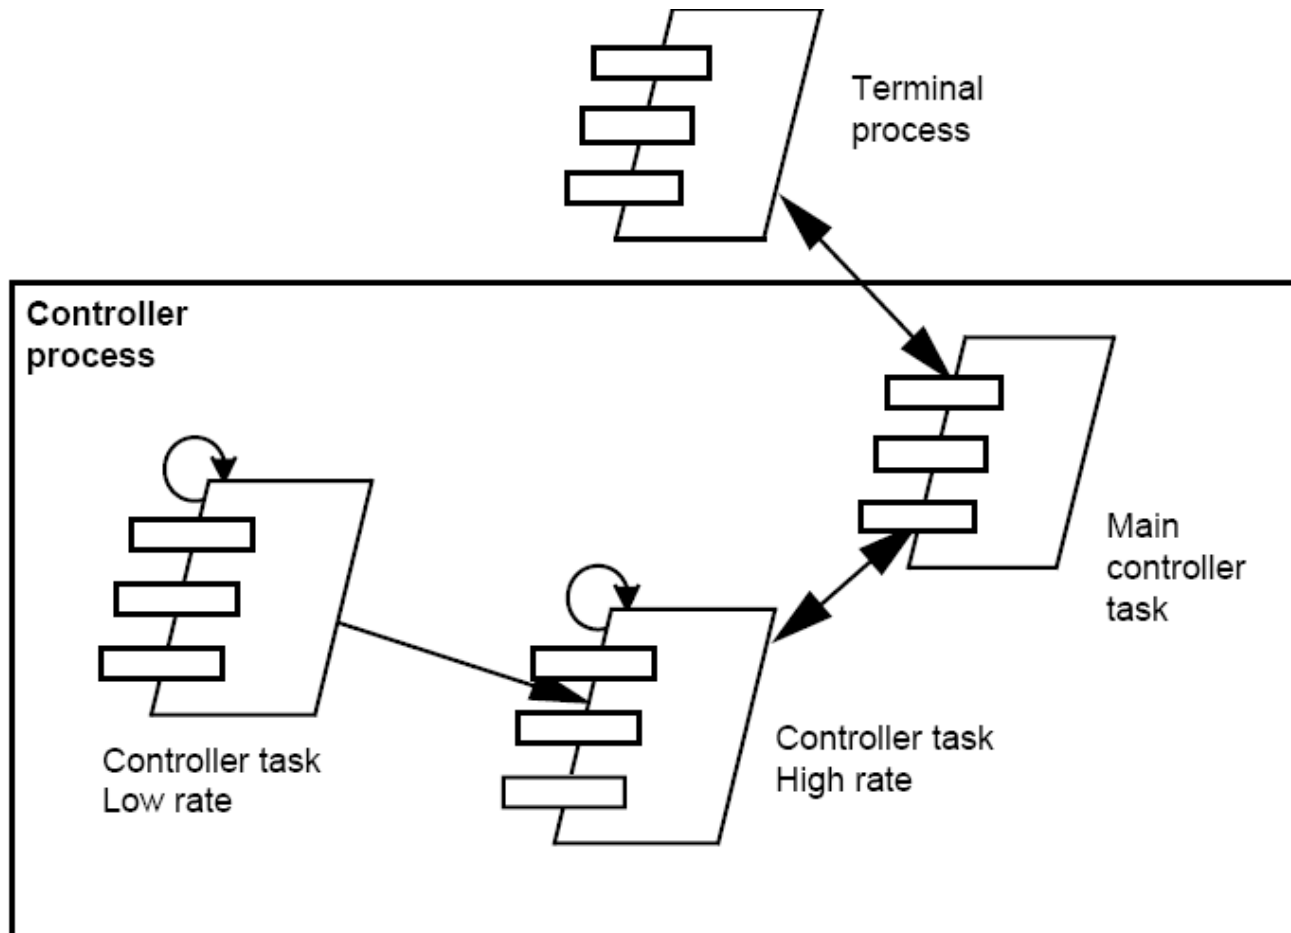

Figure 4 — Notation for the Process blueprint

# Process View example PABX (partial)-

*Philippe Kruchten, Rational Software Corp.*

# Development View

The ***development view***, which describes the **static** organization of the software in its development environment.

**Viewer:** Programmers and Software Managers

**considers:** software module organization.

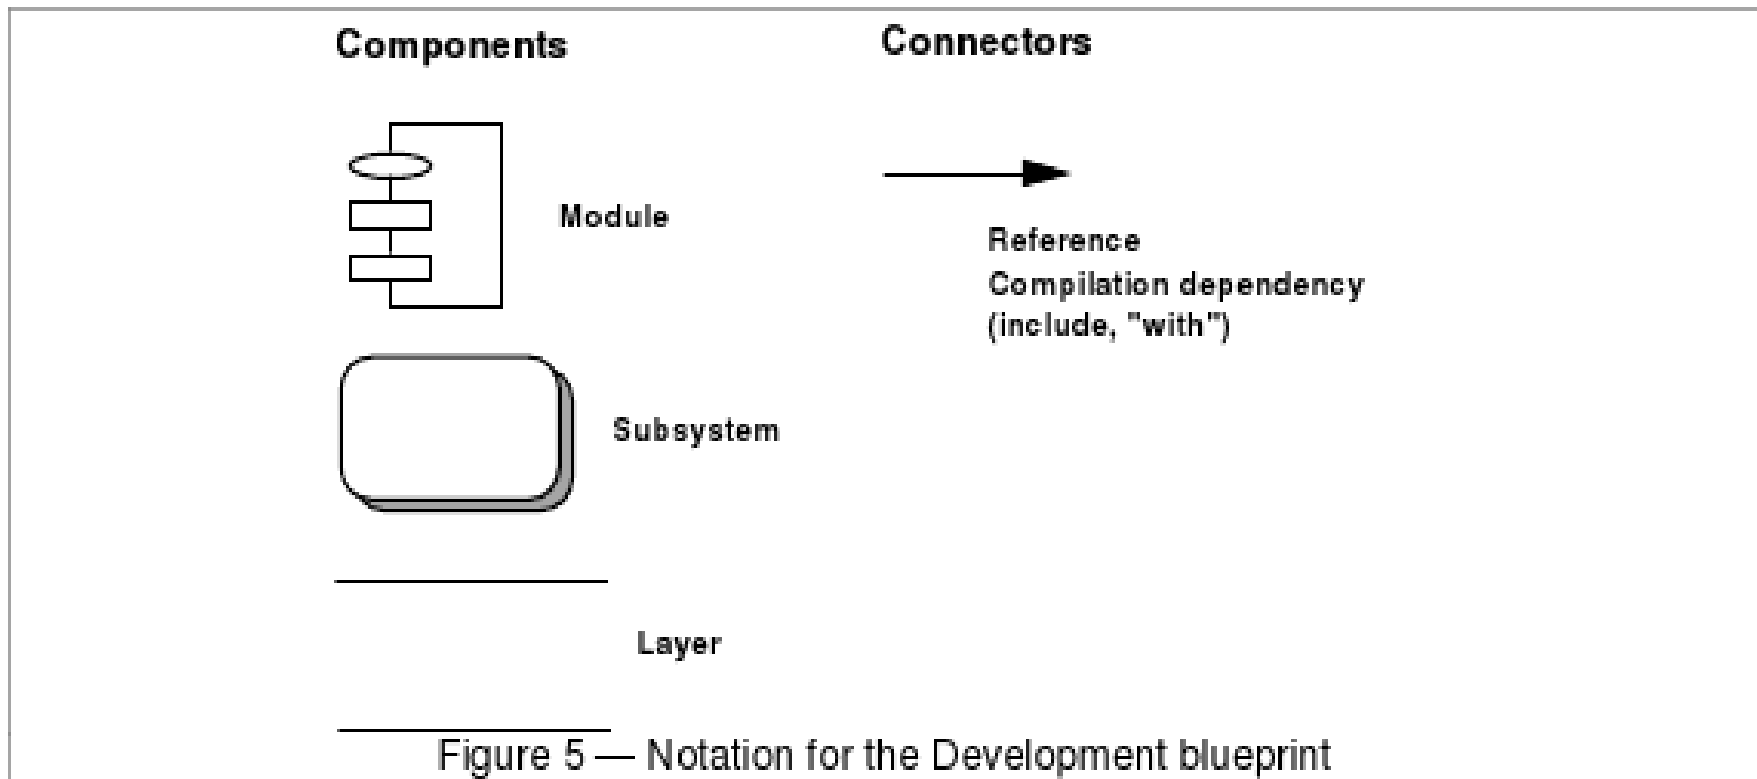

(Hierarchy of layers, software management, reuse, constraints of tools).

**Notation:** the Booch notation.

**Style:** layered style

# Notation for Development blueprint

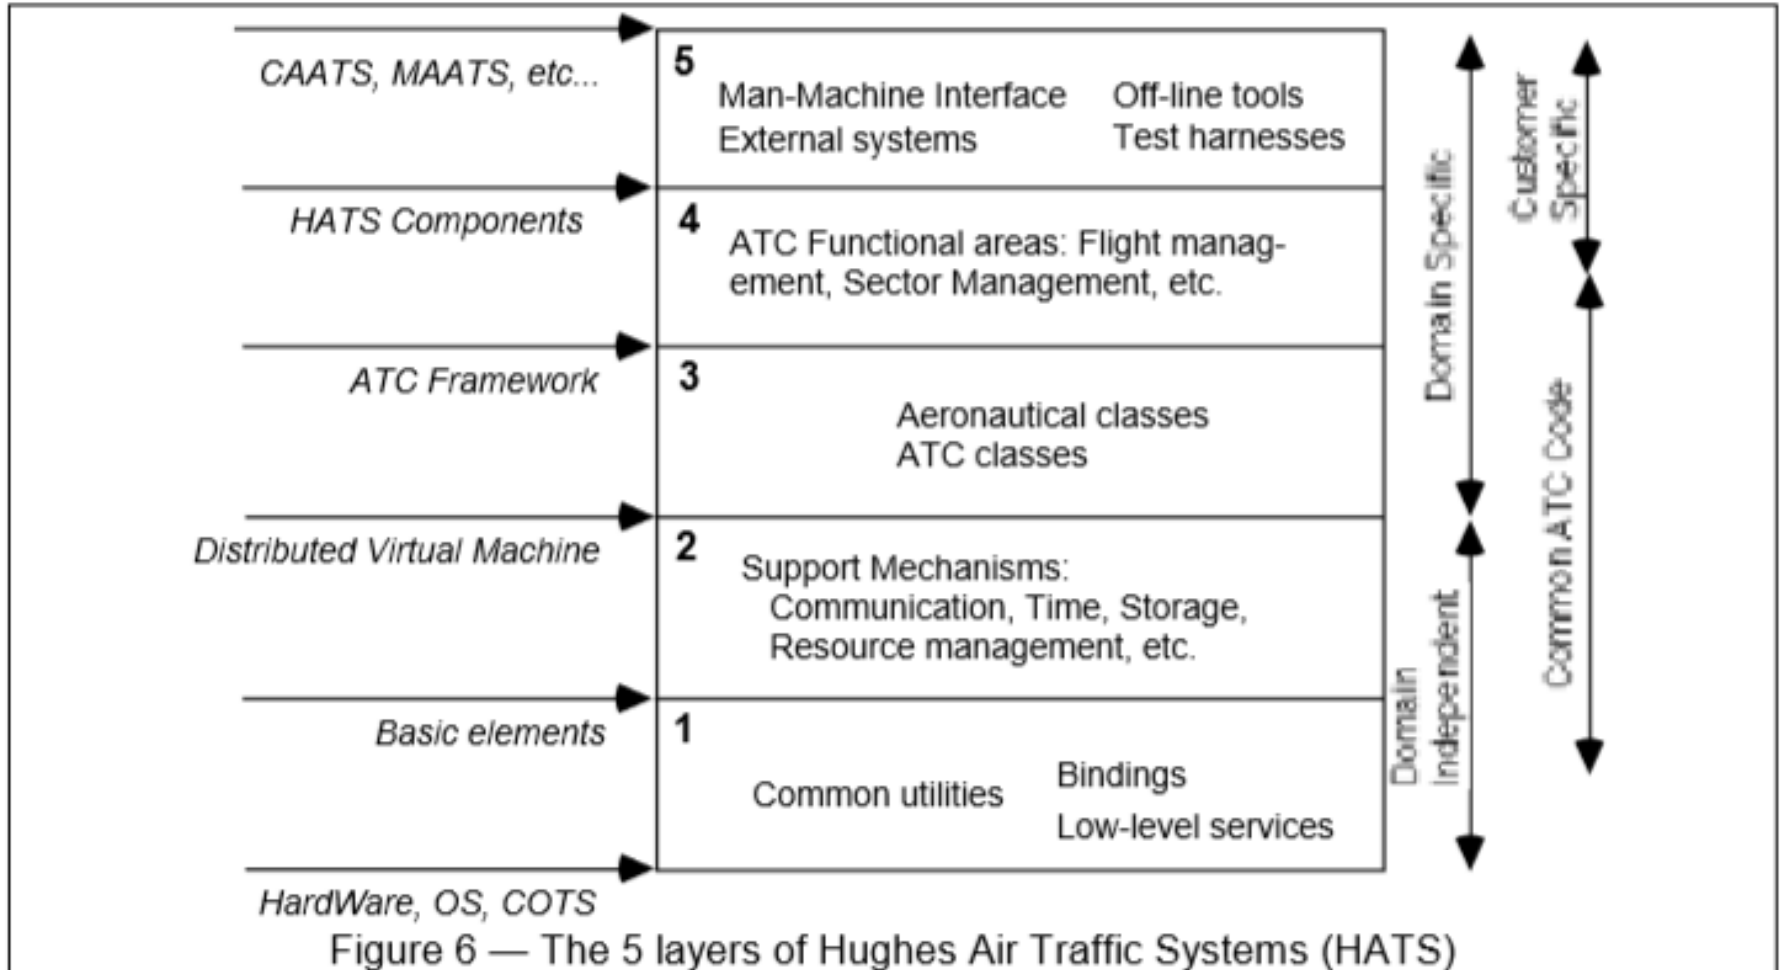

*Philippe Kruchten*, Rational Software Corp.

# Development View – Layered Style

*Philippe Kruchten*, Rational Software Corp.

# Physical View

**the physical view**, which describes the mapping(s) of the software onto the hardware and reflects its distributed aspect.

**Viewer:** System Engineers

**Considers:** Non-functional requirement (reliability, availability and performance). regarding to underlying hardware.

**There may be two architecture:**

- Test and development
- deployment

# Notation for Physical view-

*Philippe Kruchten*, Rational Software Corp.

## Components

Processor

Other device

## Connectors

- Communication line
- - - - Communication  
(non permanent)
- Uni-directional communication
- High bandwidth communication,  
Bus

## Figure 7 — Notation for the Physical blueprint

# Physical blueprint PABX-

*Philippe Kruchten, Rational Software Corp.*

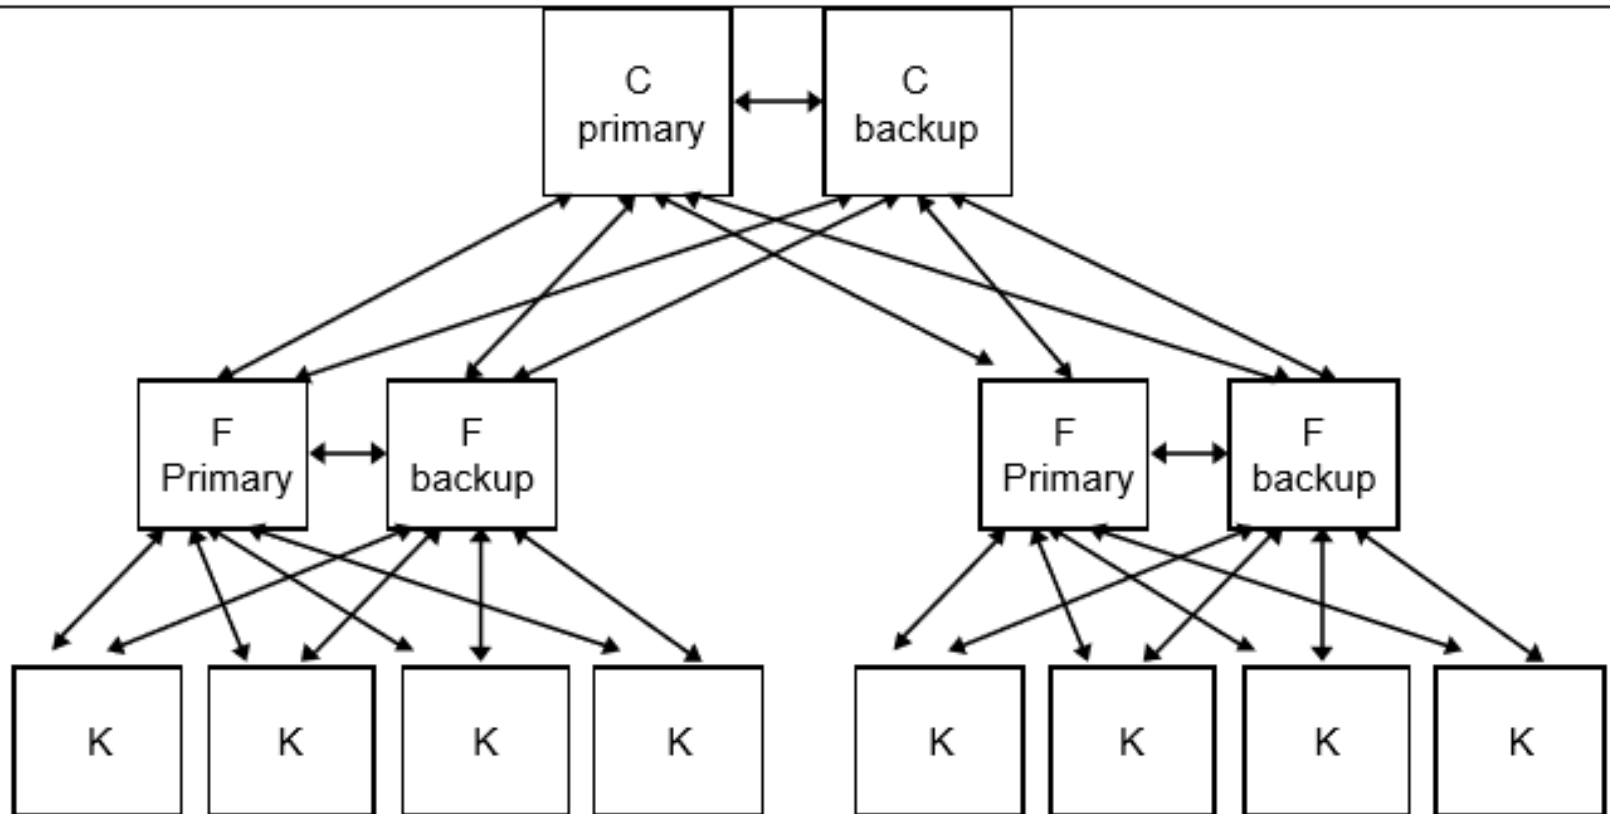

Figure 8 — Physical blueprint for the PABX

# Physical view example-

*Philippe Kruchten, Rational Software Corp.*

A small PABX physical architecture with process allocation.

# Physical view example-

*Philippe Kruchten, Rational Software Corp.*

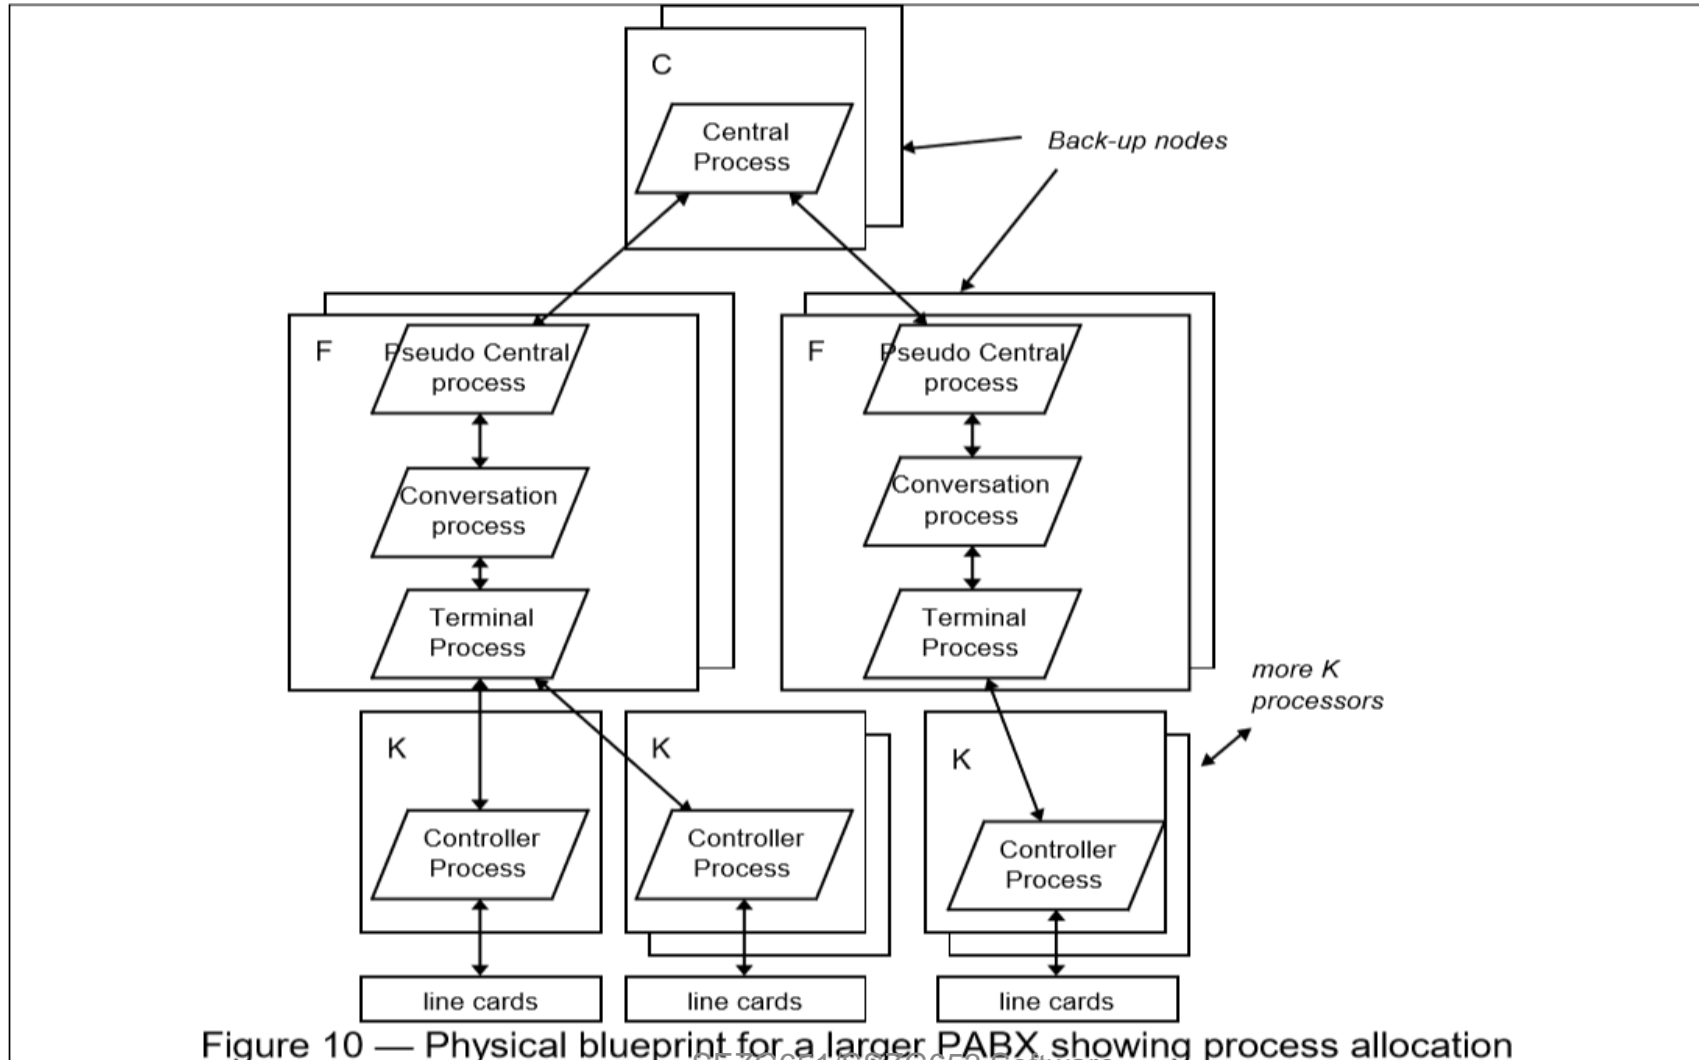

Figure 10 — Physical blueprint for a larger PABX showing process allocation

# Scenarios

(Putting all “4 views” together)

**Viewer:** All users and Evaluators.

**Considers:** System consistency and validity

**Notation:** Similar to logical view

# Scenario example-

*Philippe Kruchten, Rational Software Corp.*

Scenario for a Local call – selection phase

# Correspondence between the views

The **views** are interconnected.

Start with Logical view and Move to Development / Process view and then finally go to Physical view.

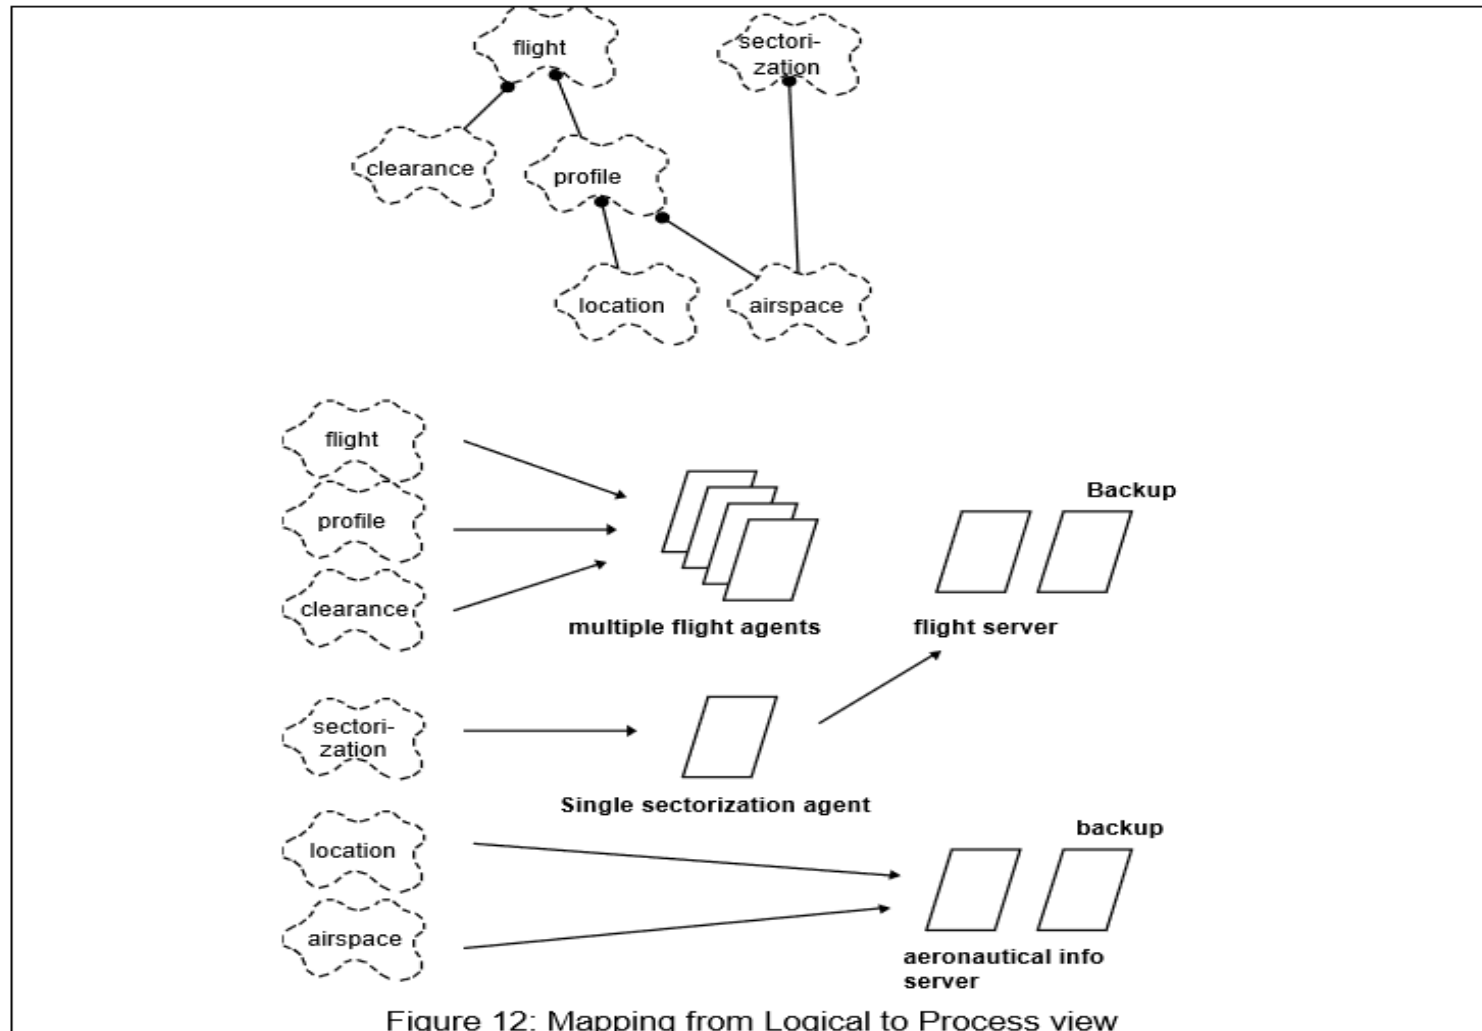

# From logical to Process view

## Two strategies :

- Inside-out: starting from Logical structure
- Outside-in: starting from physical structure

# From logical to Process view

# From Logical to development

They are very close, but the larger the project, the greater the distance between these views.

Grouping to subsystems depending on:

- The team organization.
- The class categories which includes the packages.
- The Line of codes.

# Iterative process

Not all architectures need all views.

A scenario-driven approach to develop the system is used to handle the iterative.

## Documenting the architecture:

- **Software architecture document:** follows closely “4+1” views.
- **Software design guidelines:** it captured the most important design decisions that must be respected to **maintain** the architectural **integrity**.

# Annotation:

- “4+1 views” methodology successfully used in the industry
  - Air Traffic Control
  - Telecom
- This paper missing the tools to integrate these views which lead to an inconsistency problem.
- The inconsistency problem is more tangible in the maintenance of the architecture.

# Summary

<i>View</i>	<i>Logical</i>	<i>Process</i>	<i>Development</i>	<i>Physical</i>	<i>Scenarios</i>
<i>Components</i>	Class	Task	Module, Subsystem	Node	Step, Scripts
<i>Connectors</i>	association, inheritance, containment	Rendez-vous, Message, broadcast, RPC, etc.	compilation dependency, "with" clause, "include"	Communication medium, LAN, WAN, bus, etc.	
<i>Containers</i>	Class category	Process	Subsystem (library)	Physical subsystem	Web
<i>Stakeholders</i>	End-user	System designer, integrator	Developer, manager	System designer	End-user, developer
<i>Concerns</i>	Functionality	Performance, availability, S/W fault-tolerance, integrity	Organization, reuse, portability, line-of-product	Scalability, performance, availability	Understandability
<i>Tool support</i>	Rose	UNAS/SALE DADS	Apex, SoDA	UNAS, Openview DADS	Rose
